

Flogging a dead horse or tweaking the relevant details: More experiments testing conjunct agreement

Franc Marušič
University of Nova Gorica

I will report on some spin-off experiments from the EMSS project that seem relevant both as confirmation of the specific approach to conjunct agreement advocated in Marušič et al (2015) and Willer Gold et al (2016, 2018) and more generally for how agreement works in cases where there are multiple potential goals for a single probe. One of these experiments involve coordinated noun phrases with multiple potential agreement goals of the type *the city of Frankfurt and the state of Hesse*.
